

Research Question

Do HIV education, condom use, and HIV testing predict the number of sexual partners?

Key Results

Predictor	Coefficient	P-value	Interpretation
HIV Education	-0.346	P<0.001	↓ Fewer sex partners
HIV Testing	0.552	P<0.001	↑ More sex partners
Condom use	-0.266	P<0.001	↓ Fewer sex partners

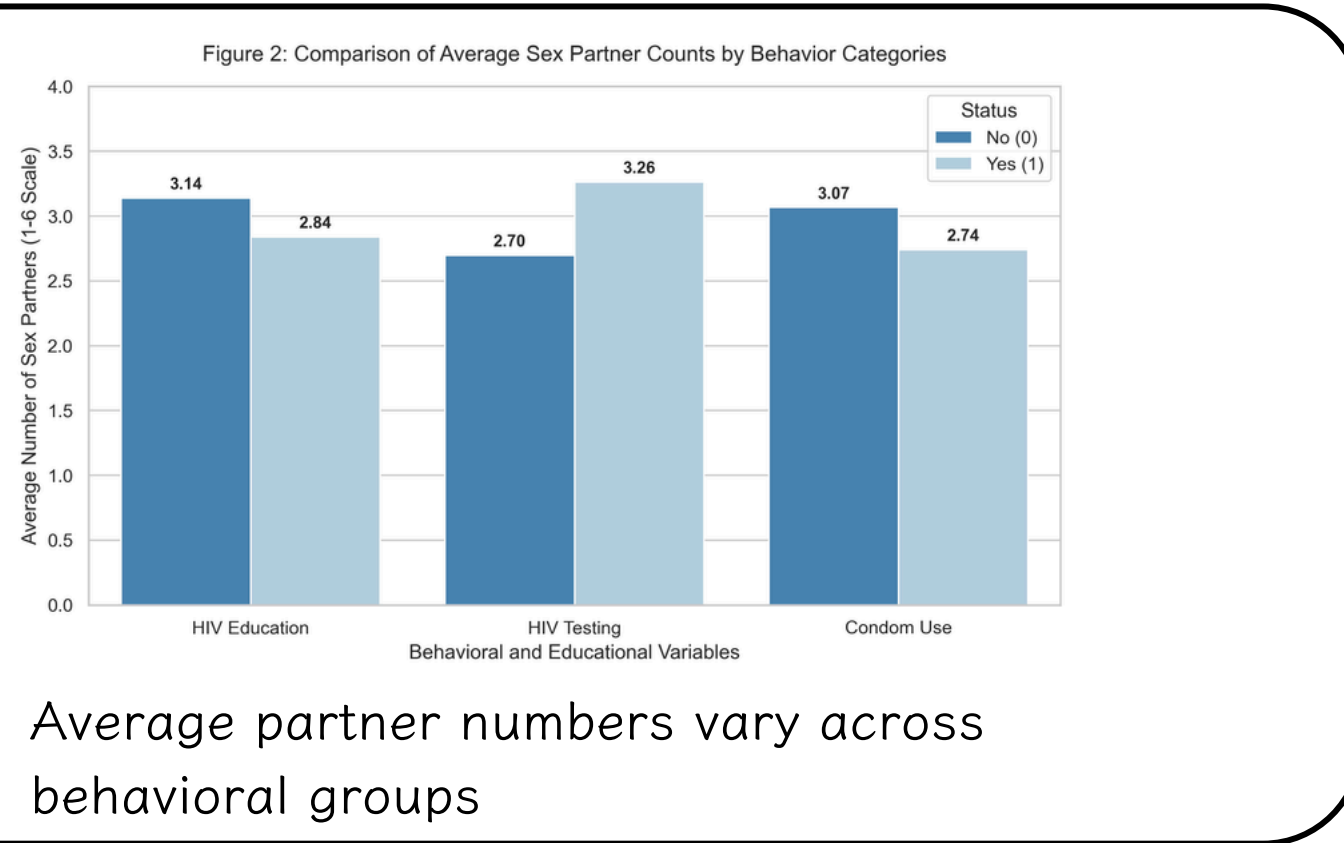

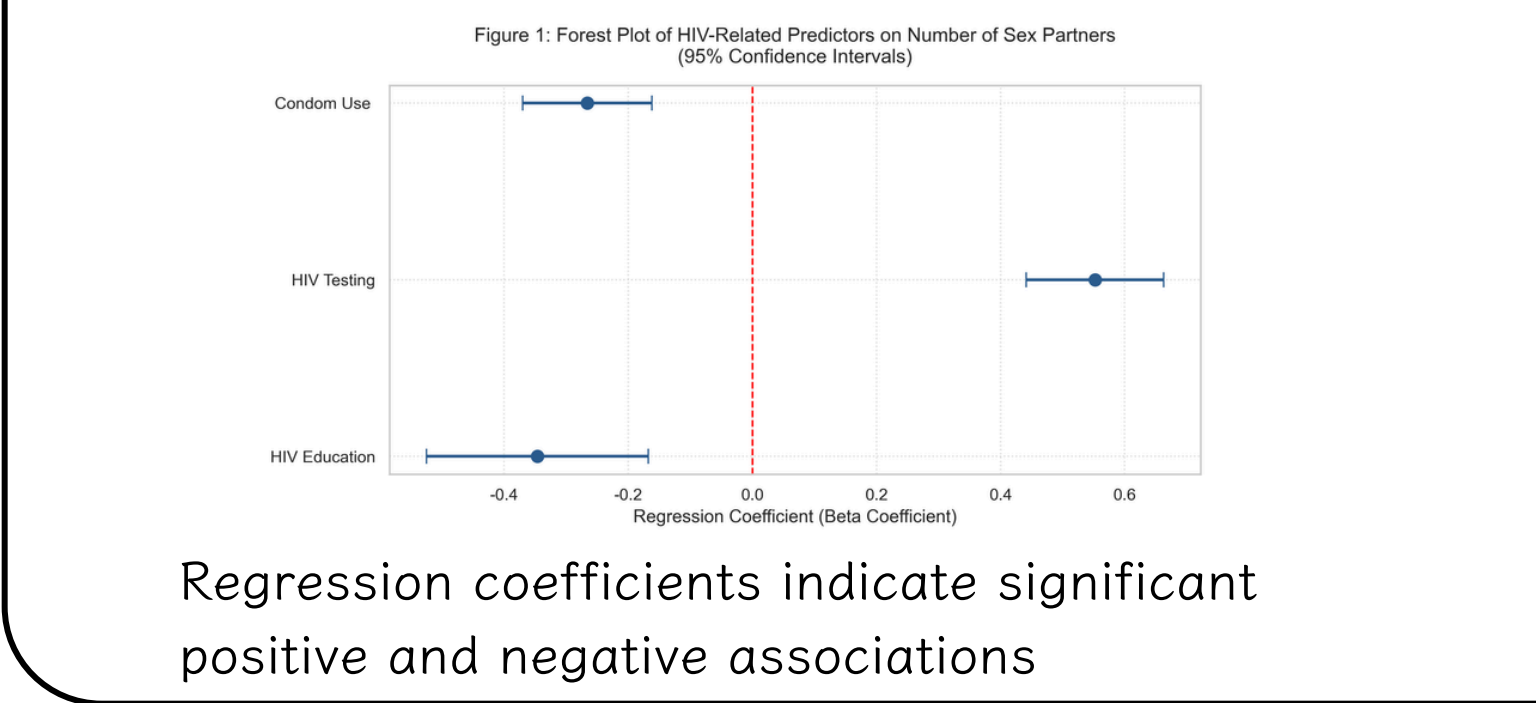

Model Summary

- N=3,761
- R²=0.037
- Adjusted R²=0.036
- F-stat=47.68
- Overall model:p<0.001

Method

- ### Linear Regression
-
- Outcome Variable
- Multiple Sex Partners
-
- Predictor Variable
- HIV education
 - HIV testing
 - Condom use

Data Visualization

Conclusion

- The regression model was statistically significant
- HIV-related behaviors were associated with sexual partner numbers
- HIV education and condom use may promote safer behaviors
- Additional factors should be explored in future studies

Practical Implications

- Promote HIV education
- Encourage condom use
- Consider additional behavioral factors
